

Tutorial 3: Stress tensor and its transformation

APL 104 - 2022 (Solid Mechanics)

Q1. A tapered beam is clamped at one end and subjected to transverse load (along \underline{e}_2) at the other end. Think of a point A on the top slanted surface of the beam. What can you say about the state of stress at point A?

Suppose that we know $\hat{\sigma}_{11}$ at pt A. Can we find the components $\tau_{21}, \sigma_{11}, \hat{\tau}_{21}$ at pt A?

Assume that traction has no components along \underline{e}_3 at any point in the body.

Q2. The state of stress at a point is given by
$$[\underline{\underline{\sigma}}] = \begin{bmatrix} \sigma_{11} & 2 & 1 \\ 2 & 0 & 2 \\ 1 & 2 & 0 \end{bmatrix}.$$

What should be σ_{11} such that there is at least one plane at that point on which the traction vanishes? Also, find the corresponding plane normal.

Q3. Suppose the stress matrix at a point equals
$$[\underline{\underline{\sigma}}] = \begin{bmatrix} a & 0 & d \\ 0 & b & e \\ d & e & c \end{bmatrix}.$$

Determine the plane having its normal perpendicular to z -axis such that the traction on that plane is tangential to the plane.

- Q4.** Consider a sphere of radius R subjected to diametrical compression as shown in the figure. Let σ_{rr} , $\sigma_{\theta\theta}$, and $\sigma_{\phi\phi}$ be the normal stresses and $\tau_{r\theta}$, $\tau_{\theta\phi}$ and $\tau_{\phi r}$ the shear stresses at any point in the sphere. At point $P(x, y, z)$ on the sphere's surface and lying in the $y - z$ plane, determine the rectangular normal stress components σ_{xx} , σ_{yy} and σ_{zz} in terms of the spherical stress components.

APL 104 Tutorial 3 solutions

Q1. A tapered beam is clamped at one end and subjected to transverse load (along \underline{e}_2) at the other end. Think of a point A on the top slanted surface of the beam. What can you say about the state of stress at point A? Suppose we know $\hat{\sigma}_{11}$ at point A. Can we find the components $\tau_{21}, \sigma_{11}, \hat{\tau}_{21}$ at point A? **Assume** that traction has no components along \underline{e}_3 at any point in the body.

Solution:

Notice that point A lies on the slanted surface where no external load is being applied! Furthermore, the slanted surface has normal $\underline{\hat{e}}_2$.

This implies $\underline{\hat{t}}^2 = \underline{0}$ at point A (this does not mean $\underline{t}^2 = \underline{0}$)

If we write the stress matrix in a coordinate system of $(\underline{\hat{e}}_1, \underline{\hat{e}}_2, \underline{\hat{e}}_3)$, then the 2nd column will be zero ($\underline{\hat{t}}^2 = \underline{0}$). Furthermore, the third row will also be zero since tractions have zero components along \underline{e}_3 (which equals $\underline{\hat{e}}_3$). Thus,

$$[\underline{\underline{\sigma}}(A)]_{(\underline{\hat{e}}_1, \underline{\hat{e}}_2, \underline{\hat{e}}_3)} = \begin{bmatrix} X & 0 & X \\ X & 0 & X \\ 0 & 0 & 0 \end{bmatrix}$$

But, we know that stress matrix is also symmetric

$$[\underline{\underline{\sigma}}(A)]_{(\underline{\hat{e}}_1, \underline{\hat{e}}_2, \underline{\hat{e}}_3)} = \begin{bmatrix} X & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Thus, $\hat{\sigma}_{11}$ is the only non-zero quantity!

Note that $\hat{\tau}_{21}=0$ (since $\hat{\tau}_{12} = 0$)

From here, we can then transform the stress matrix to $(\underline{e}_1, \underline{e}_2, \underline{e}_3)$ coordinate system

$$\text{If } \hat{\underline{e}}_i = \underline{\underline{R}} \underline{e}_i \Rightarrow [\underline{\underline{R}}]_{(\underline{e}_1, \underline{e}_2, \underline{e}_3)} = \begin{bmatrix} \cos \theta & \sin \theta & 0 \\ -\sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow [\hat{\underline{\sigma}}] = [\underline{\underline{R}}]^T [\underline{\sigma}] [\underline{\underline{R}}]$$

$$\begin{aligned} \Rightarrow [\underline{\sigma}] &= [\underline{\underline{R}}] [\hat{\underline{\sigma}}] [\underline{\underline{R}}]^T \\ &= \begin{bmatrix} c\theta & s\theta & 0 \\ -s\theta & c\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \hat{\sigma}_{11} & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} c\theta & -s\theta & 0 \\ s\theta & c\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ &= \begin{bmatrix} c\theta & s\theta & 0 \\ -s\theta & c\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \hat{\sigma}_{11}c\theta & -\hat{\sigma}_{11}s\theta & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \\ &= \begin{bmatrix} \hat{\sigma}_{11} \cos^2 \theta & -\hat{\sigma}_{11} s\theta c\theta & 0 \\ -\hat{\sigma}_{11} s\theta c\theta & \hat{\sigma}_{11} \sin^2 \theta & 0 \\ 0 & 0 & 0 \end{bmatrix} \\ \Rightarrow \sigma_{11} &= \hat{\sigma}_{11} \cos^2 \theta \\ \tau_{12} = \tau_{21} &= -\hat{\sigma}_{11} \sin \theta \cos \theta \\ \sigma_{22} &= \hat{\sigma}_{11} \sin^2 \theta \end{aligned}$$

There is another way to obtain these components!

Let us first obtain the traction on \underline{e}_1 -plane using $\underline{t}^1 = \underline{\sigma} \underline{e}_1$. As we have $[\underline{\sigma}]$ readily available in the ‘hat’ coordinate system, we can write the tensor formula to obtain $[\underline{t}^1]$ in the ‘hat’-coordinate system.

$$\begin{aligned} \Rightarrow [\underline{t}^1]_{(\hat{\underline{e}}_1, \hat{\underline{e}}_2, \hat{\underline{e}}_3)} &= [\underline{\sigma}]_{(\hat{\underline{e}}_1, \hat{\underline{e}}_2, \hat{\underline{e}}_3)} [\underline{e}_1]_{(\hat{\underline{e}}_1, \hat{\underline{e}}_2, \hat{\underline{e}}_3)} = \begin{bmatrix} \hat{\sigma}_{11} & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \cos \theta \\ \sin \theta \\ 0 \end{bmatrix} = \begin{bmatrix} \hat{\sigma}_{11} \cos \theta \\ 0 \\ 0 \end{bmatrix} \\ \Rightarrow \sigma_{11} = \underline{t}^1 \cdot \underline{e}_1 &= [\underline{t}^1]_{(\hat{\underline{e}}_1, \hat{\underline{e}}_2, \hat{\underline{e}}_3)} \cdot [\underline{e}_1]_{(\hat{\underline{e}}_1, \hat{\underline{e}}_2, \hat{\underline{e}}_3)} = \begin{bmatrix} \hat{\sigma}_{11} \cos \theta \\ 0 \\ 0 \end{bmatrix} \cdot \begin{bmatrix} \cos \theta \\ \sin \theta \\ 0 \end{bmatrix} = \hat{\sigma}_{11} \cos^2 \theta! \end{aligned}$$

Caution: Don’t make a mistake by writing $[\underline{e}_1]_{(\hat{\underline{e}}_1, \hat{\underline{e}}_2, \hat{\underline{e}}_3)} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

Q2. The state of stress at a point is given by $\underline{\underline{\sigma}} = \begin{bmatrix} \sigma_{11} & 2 & 1 \\ 2 & 0 & 2 \\ 1 & 2 & 0 \end{bmatrix}$.

What should be σ_{11} such that there is at least one plane at that point on which the traction vanishes? Also, find the corresponding plane normal.

Solution:

We basically want $\underline{\underline{\sigma}} \underline{n} = \underline{0}$ for at least one \underline{n} !

$$\text{or, } \begin{bmatrix} \sigma_{11} & 2 & 1 \\ 2 & 0 & 2 \\ 1 & 2 & 0 \end{bmatrix} \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

From matrix property, we know that this happens only when the determinant of the matrix vanishes

$$\begin{aligned} \Rightarrow \det(\underline{\underline{\sigma}}) &= \sigma_{11} \times [-4] - 2 \times [-2] + 1 \times 4 = 0 \\ &\Rightarrow -4\sigma_{11} + 4 + 4 = 0 \\ &\Rightarrow \sigma_{11} = 2 \end{aligned}$$

The corresponding \underline{n} turns out to be $\underline{n} = \begin{bmatrix} \pm 2/3 \\ \pm 1/3 \\ \pm 2/3 \end{bmatrix}$

Q3. Suppose the stress matrix at a point equals $\underline{\underline{\sigma}} = \begin{bmatrix} a & 0 & d \\ 0 & b & e \\ d & e & c \end{bmatrix}$.

Determine the plane having its normal perpendicular to z -axis such that the traction on that plane is tangential to the plane.

Solution:

We have to find $\underline{n} = \begin{bmatrix} n_x \\ n_y \\ 0 \end{bmatrix}$ ($n_z = 0$ since $\underline{n} \perp \underline{e}_3$)

It is given that \underline{t}^n has only tangential component

$$\begin{aligned} \Rightarrow \underline{t}^n \cdot \underline{n} &= 0, \text{ or } (\underline{\underline{\sigma}} \underline{n}) \cdot \underline{n} = 0 \\ \Rightarrow \left(\begin{bmatrix} a & 0 & d \\ 0 & b & e \\ d & e & c \end{bmatrix} \begin{bmatrix} n_x \\ n_y \\ 0 \end{bmatrix} \right) \cdot \begin{bmatrix} n_x \\ n_y \\ 0 \end{bmatrix} \\ \Rightarrow an_x^2 + bn_y^2 &= 0 \end{aligned}$$

At the same time $n_x^2 + n_y^2 = 1 \Rightarrow n_y^2 = 1 - n_x^2$

$$\begin{aligned} \therefore an_x^2 + b(1 - n_x^2) &= 0 \\ \Rightarrow n_x &= \pm (b/(b-a))^{1/2}, \quad n_y = \pm (a/(a-b))^{1/2}, \quad n_z = 0 \end{aligned}$$
